FIRST MILESTONE
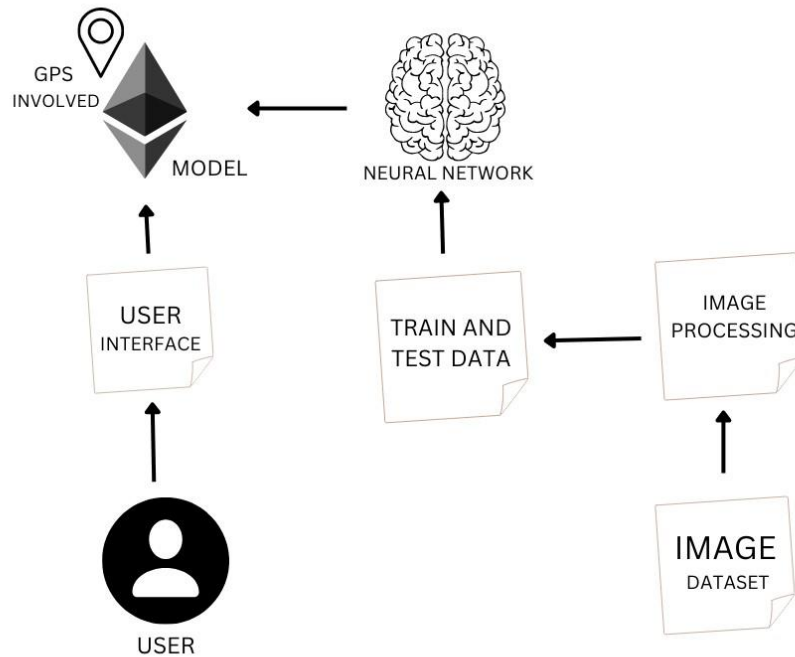

PROJECT THEME:

- By implementing this project we get a clear knowledge of neural networks.
- This project is based on image processing and voice recognition.
- Firstly should train a dataset and test dataset are uploaded in the image set.
- Whenever the user require to recognized the data in front of them, the object is detected at particular distance.
- Then they are sensed by the user interface thus get transferred to the project model to be sensed.
- Then the data is compared with the dataset in the convolutional neural networks.
- Then required output is given in vocal form to the user.
